

Task for Mobile App Development Interns: Social Connect App Development

Overview

You will work on creating a app called **Social Connect**, a minimal social media platform with key features such as user authentication, profile management, posting updates, and interacting with other users. This task will be divided into three weeks with clear milestones. The final submission must include:

1. A **recorded video** showcasing the project running.
2. A **public GitHub repository link** containing your project code.

Week 1: Core Features and Basic Setup

1. Project Initialization

- Set up the React Native project using `npm react-native init`.
- Configure ESLint/Prettier for code linting and formatting.

2. Authentication System

- Create screens for **Sign Up**, **Login**, and **Forgot Password**.
- Use Firebase Authentication or a mock API for managing user authentication.
- Validate input fields using `yup` and `formik`.

3. Navigation

- Implement navigation using React Navigation (Stack and Tab Navigators).
- Add screens for **Home**, **Profile**, and **Settings**.

4. User Profile Setup

- Create a profile creation/edit page with fields like **name**, **bio**, and **profile picture**.
- Allow users to upload a profile picture (use libraries like `react-native-image-picker`).

Week 2: Main App Features

1. Post Management

- Implement a **Post Feed**:
 - Allow users to create text-based posts (with optional images).
 - Save and fetch posts from a backend (mock API or Firebase Firestore/Express.js).
 - Display posts in a vertically scrollable list (**FlatList**).
 - Show timestamps for posts.

2. Like and Comment System

- Enable users to **like** and **unlike** posts.
- Create a modal or a separate screen for **comments**.

3. User Profiles

- Implement a profile view page for users.
- Allow users to view other users' profiles by tapping on their names in the post feed.

4. State Management

- Use **Redux Toolkit** or **React Context API** for managing global states (e.g., auth state, posts, likes).

Week 3: Advanced Features and Polishing

1. Notifications

- Use **expo-notifications** or Firebase Cloud Messaging to notify users when someone likes/comments on their posts.

2. Real-time Updates

- Implement real-time updates for likes and comments using Firebase Realtime Database or Socket.io.

3. UI and Animations

- Add animations for interactions (e.g., liking a post) using **react-native-reanimated** or **Lottie**.

- Make the app responsive for different device sizes using `react-native-responsive-dimensions`.

4. Final Polishing

- Ensure smooth navigation between screens.
- Optimize app performance and reduce unnecessary re-renders.
- Fix any known bugs and improve error handling.

Submission Details

1. Deadline: **26th June, 2026.**

Submission Format:

- **Video** demonstrating your project running.
- **GitHub public repository link** with your complete project code.
